The Reversal Process

A woman who regrets her decision after taking the first pill can save her pregnancy, but time is of the essence!

1

Progesterone is administered to reverse the effects of the abortion pill.

2

An ultrasound confirms viability of the baby.

3

Progesterone treatments continue for a minimum of two weeks.

4

Ongoing support continues through a referred local pregnancy center.

Success Stories

"Everything went well, I just had an ultrasound and found out I'm having a boy. The child's father and I are both excited, so glad I found you guys in the heat of the moment. Thank you for everything."

-APRN Client, December 2022

"The baby is okay!!! I had an ultrasound and everything is normal. Heartbeat is good... Thank you so much for everything! You guys saved my baby and I'm forever grateful."

-APRN Client, December 2022
